Something went wrong. What am I going to learn? After that, we will see the dependence between longitudinal and lateral forces using the Kamm circle and the Krempel diagram. The slip angle gives rise to curvature forces, which are essential to understanding the lateral dynamic. At the end of the course understand the basic principles of the curves of a car. 3 hours a week preparing for the exam Do I get a certificate? Next, we will investigate the steady state of curves, the stability and influence of the different weight distributions between the car's inner and outer side wheels. Some basic knowledge of the following topics will help you successfully participate in this course: algebra; Trigonometric functions; Differential Calculation; linear algebra; Vectors; Coordinate systems; Force, Torque, Balance; Mass, Center of Gravity, Moment of Inertia; Sections, Friction, Newton's Law, (Lagrange's) Workload approx. Wait a moment and try again. In this second part of Vehicle Dynamics, we will illuminate the dynamic lateral aspects of the vehicles. and brief: the curves of a car. In detail: We'll start with a simple one-way model and then describe the sliding angle of a wheel. The course will end with two applications of automotive single mechatronics. be able to calculate the simple properties of a car.
