Chemical formula for respiration in plants

Chemical formula for anaerobic respiration in plants. What is the equation for respiration in plants. What is the chemical equation for respiration in plants. What is the chemical formula for cellular respiration in plants and animals. What is the chemical formula for respiration.

Organic process to convert light into the composite image of chemical energy showing the global distribution of photosynthesis, including both the oceanic phytoplankton and terrestrial vegetation. Dark Red and Blue-Green indicate regions of high photosynthetic activity in the ocean and on earth, respectively. The overall equation for the type of photosynthesis that occurs in the photosynthesis of the plants is a process used by plants and other bodies to convert light energy into chemical energy which, through cellular respiration, can be subsequently released to feed the activities Of the body. This chemical energy is stored in carbohydrate molecules, such as sugars and starches, which are synthesized by carbon dioxide and water - from which the photosynthesis name, from the Greek $\phi\acute{o}\tau\omicron\varsigma$ ("Light" and $\sigma\upsilon\tau\eta\sigma\iota\varsigma$ ("putting together"). [1] [2] [3] In most cases, oxygen is also released as a waste product. Most plants, algae and cyanobacteria perform photosynthesis; These organisms are called FotoAutrofos. Photosynthesis is largely responsible for the production and maintenance of the oxygen content of the earth's atmosphere and provides most of the energy needed for life on Earth. [4] Although photosynthesis is performed differently from different species, the process always starts when energy from light is absorbed by protein
